

Midterm Project

The midterm project will consist of some exercises from the first seven chapters of the textbook and use one of the running case studies that the textbook describes throughout. For the case study assigned for this semester, you will complete a series of questions that takes you from an initial business benefits study to the development of requirements, use cases, and sequence diagrams - as well as define security controls for the hypothetical company. Turn in your completed project in the dropbox.

Formatting

This should be written as a cohesive business document with all of the necessary diagrams, tables, etc. There are few specific requirements:

1. Title Page is required
2. Use 11pt or 12pt font for your body text
3. Use builtin styles of Word such as headings, lists, captions, etc.
4. All diagrams/tables should have captions

Fall:

Running Case Study - On the Spot Courier Services

1. Create a System Vision Document using the outline in Figure 1-8 in chapter 1. Include sections for the Problem Description, System Capabilities, and Business Benefits. You should include at least one paragraph for the problem description, five capabilities and five business benefits for the sections respectively.

2. Using the case study description in chapter 2, describe the following aspects for this project:

- a. List at least three stakeholders
- b. List at least ten functional requirements, as well as at least three usability, reliability, security, and performance requirements each for the system
- c. List at least five sample questions you would ask of the stakeholders in the system when gathering requirements for the system

3. Using the textbook material from chapters 3-5, list the following aspects for your use case analysis:

- a. Define at least three actors for your use cases
- b. Define at least five use cases for the system. These should be in a simple actor->verb form (e.g., actor 1 does the following in the system) at a granular level.
- c. Include a use case diagram for your actors and use cases.
- c. Write a fully developed use case of what you consider to be the most important use case using the model template in Figure 5-2.

4. List at least five high-level security controls for your subsystems in the project using the broad categories in chapter six of the textbook. Also, list specifically what data you would encrypt and what would be the risks

and potential consequences if the data were exposed to hackers.
